

Stone 18

The data I chose for my set of data would be the data about the WNBA predictions. This set of data is about the different game predictions of the WNBA. Stats for example, about the games, home and away team scores and also data about games for different seasons. This set of data uses different adjustments like home court advantage or playoff adjustment. When the different teams in the WNBA plays, the winning team earns point and the bigger the win, the more points that you earn. I chose this set of data because basketball is an important thing in my life and it is also something that interests me very much. So I thought that this set of data would fit me the best while also being of interest to me.
